

Wireshark - Analyzing Network Traffic

Investigating Malware with Wireshark – Network Traffic Analysis

During my six-month cybersecurity training, I had the opportunity to perform real-world network traffic analysis using Wireshark.

Our task was to analyze a PCAP file that captured a malware infection within a network. Using Wireshark, I was able to trace:

- ✓ The infected device that initiated suspicious connections
- ✓ The malware's communication pattern with external IP addresses
- ✓ Unusual DNS requests and HTTP traffic indicating command-and-control behavior

By applying filters and inspecting packet details, I identified the flow of malicious traffic and how it propagated through the network.

This project helped me understand how malware communicates, exfiltrates data, and disguises its activity within normal traffic.

Wireshark strengthened my ability to detect, investigate, and interpret network anomalies skills essential for any SOC Analyst or Incident Responder.
